how to unlock nokia 1208. Nokia 1208 is one of the Nokia's phones which are lagging behind and always run on older android version i.e. Jelly bean. To overcome this issue, the owners can update their device to latest Android version like Android Jelly Bean 4.2.2 using the Nokia 1208 Unlocking tool. If you can not remember your Nokia phone security code, you can do a factory reset. You'll get all of your personal data back. This can help if you have forgotten your phone's security code. Once reset is complete, you'll need to enter the phone's security code to access your data again.

Q: In Python, how to check if a file exists when it has spaces in it I am trying to build a script that will print the text of a file if it exists and do nothing if it does not. The problem is when I have spaces in the file name the script does not recognise it as an existent file. So for example if I have: file.txt and the following code: `file = open("file.txt","r") print file.read()` it will not print the file contents. I have tried to escape the space, but I cannot get it to work.

A: You can read the contents of the file directly into a string (you can even use `with` to make it more efficient). `with open("file.txt", "r") as f: print f.read()` You can read directly from the file object returned by `open()` with `open("file.txt", "r") as f: print f.read()` printing the contents of the file object. You can also use `file.read()` to access the file's contents without a file object (this is useful for debugging).

A: You can do: `file = open("file.txt","r") print file.read()` I think that will work for you. // Copyright (c) 2019 Uber Technologies, Inc. // // Licensed under the Apache License, Version 2.0 (the "License"); // you may not use this file except in compliance with the License. // You may obtain a copy of the License at // // 2d92ce491b
