Treatment with R(+)-1, R(+)-2, and R(+)-3 also attenuated carrageenan-induced paw oedema in rats, and the anti-inflammatory effects were as potent as those of indomethacin, a classic COX inhibitor. The effective dose of R(+)-1 for mouse ear oedema and rat paw oedema (48 and 30 h after carrageenan treatment, respectively) was less than that of indomethacin. The in vivo antinociceptive effect of R(+)-1 was also investigated in various mouse models. R(+)-1 potently inhibited acetic acid-induced writhing in mice, but not in rats. In a hot plate test, R(+)-1, R(+)-2, and R(+)-3 had an antinociceptive effect on male ICR mice, although the effect was less than that of the positive control, morphine. On the other hand, in a tail-flick test, R(+)-1, R(+)-2, and R(+)-3 did not show any antinociceptive effect on male ICR mice. These results suggest that COX-2 and cyclo-oxygenase-1 (COX-1), which is responsible for the inhibitory effect 3ef4e8ef8d
