Field of the Invention The present invention relates to a tracheostomy tube, and more particularly, to a tracheostomy tube including a rigid sleeve that can be swiveled to a plurality of orientations relative to the tracheal tube. 2. Description of the Related Art Tracheostomy tubes are used to provide access to a patient's trachea for a variety of medical purposes. Traditionally, a surgical incision is made in the neck of the patient to form an opening through the neck tissue, into the trachea, for insertion of a tube into the patient's trachea. This type of tube is typically positioned so that the distal end is below the opening in the trachea and the proximal end is positioned at or just above the patient's mouth to permit the patient to speak and to cough. To control the positioning of the distal end of the tracheostomy tube, a guidewire can be passed through the tracheostomy tube to guide the proximal end of the tube to a desired location in the patient's mouth. The use of a tracheostomy tube can be uncomfortable and stressful for the patient. Because of the size of the tube, the patient must remain immobile. Additionally, the opening in the patient's neck has a tendency to heal in a scarred configuration. The incision for tracheostomy tubes has been minimized by the introduction of tracheostomy tubes that can be inserted percutaneously. A percutaneous tracheostomy tube is one that is inserted through a puncture or channel made in the skin of the neck of the patient rather than through an incision in the neck of the patient. A percutaneous tracheostomy tube may be preferred in patients in whom a surgical incision is not medically appropriate, such as in burn patients or neurosurgery patients. Insertion of a percutaneous tracheostomy tube may be performed with local anesthesia. A trache
