The electron transfer of 1-methoxy-4-phenylamino-7-nitrobenzotriazole (MPO) and 1-methoxy-4-phenylamino-7-nitrobenzotriazole with a methyl ester of 4-hydroxy-2,2,6,6-tetramethyl-1-piperidinyloxy (TEMPOL) has been studied by electrochemical methods in aqueous media in order to determine whether or not the electron transfer reactions are irreversible. It has been observed that the reactivity of MPO for TEMPOL decreased when using piperidine-2-ethanol as a solvent and also when the concentration of TEMPOL was increased. Electron transfer also decreased to this extent when the concentrations of MPO and TEMPOL were increased from 0.1 to 10 mM, showing that the reaction is limited by the concentrations of the reagents. In the case of MPO, the limiting rate constant has been calculated, showing that the reaction is not truly irreversible in physiological concentrations of the reagents. However, the reaction of MPO with TEMPOL in the presence of piperidine-2-ethanol exhibits characteristics of an irreversible reaction. The decrease in reactivity is a result of the reaction being limited by the concentrations of the reagents.Q: How to set the background of a button? Here's what I have so far:
