## Free Port Explorer Crack + X64 [Updated]

Stay alert with the small tool Free Port Explorer. The screen of the program stays minimalist and it's easy to spot open ports, used to scan the network. Most of the users are familiar with the terms port scanning, port monitoring and port statistics. But they rarely look to a program that is open and free to use. Even if you are sure that you do not need a program for a specific purpose, it's worth to take a look at this tool that is described as being simple, lightweight, portable, and easy to use. Free Port Explorer is the perfect tool for those who are looking for open ports and IP addresses of connected computers on the network. You can use it at home, at the office or during an online connection, making sure that your system is safe from online attacks. In order to access the service of Free Port Explorer, you need to download the executable file that is freely available from the Internet and use it to scan your network for opened ports. Once you start the program, you'll notice that it will ask for administrator access, but you can also go to the Options and disable this prompt. After opening the program, you will see a window that has a simple interface with three main tabs: Status, Scanned and Running. The first two tabs are just for viewing the information of the opened ports, while the third one lists the processes that are responsible for the open ports on the network. You'll also notice the two icons on the top right of the program's interface: Open and Update. With the Open icon, you can send the list of open ports to your clipboard, while the Update icon allows you to refresh the list or to open a new session. When you close the program, a summary will appear in the notification area of your system tray. It will inform you about how many ports were opened and how much data were stored. You can see the data stored in a csv file as well, which allows you to export them and use them for offline analysis. Free Port Explorer is open source software and it's freely available from the authors website, The license allows you to use and copy it, but allows you to give it away as a gift to other users. However, you can not modify or redistribute it in any form. Features of Free Port Explorer Simple interface The interface of the program is quite simple, but it offers just the basic features for scanning and monitoring ports on your system. You can

The "KeyMacro" is a small utility for the Windows desktop that can be used to perform complex tasks within a single window. It does not require a keyboard or mouse to be used. Using KeyMacro, you can define several macros that can be later assigned to any hotkeys, and subsequently run them with the click of a mouse. KeyMacro is especially useful to perform simple tasks in the Windows desktop. In addition to hotkeys, you can create scripts to run various actions from within the "KeyMacro" window. For example, you could copy the entire contents of one folder to another location, filter out several types of files, remove old files from a folder, or perform other tasks. You can define as many scripts as you wish. The "KeyMacro" window will display each script, along with its description and actions. You can assign one script to a single hotkey or the "Alt" key, or as many as you need. Once assigned, the script is executed by using the hotkey or by pressing the "Alt" key. If you have multiple scripts assigned, the "KeyMacro" window will display them all. If you click on a script, it will be executed and the results will be displayed. You can run multiple scripts simultaneously. To create a new script, double-click in the "KeyMacro" window. When the script is saved, a description of the script will be displayed, along with its text, the commands for the hotkey or "Alt" key, and the optional arguments. KeyMacro can open or delete files and folders. To open a folder, simply click in the folder on the "KeyMacro" window. Once the folder is opened, you can filter the files inside the folder. To filter, click the field next to the filter text (Filter by Name, for example). To delete a file, click in the file on the "KeyMacro" window, and then click the Delete button. To delete a folder, simply click in the folder on the "KeyMacro" window and then click the Delete button. If the data is not important, you can delete the selected files and folders by using the Delete or Yes/No buttons on the "KeyMacro" window.
