Difference between AutoCAD and AutoCAD LT AutoCAD LT is the successor to AutoCAD for smaller businesses. AutoCAD LT includes a subset of features and options from AutoCAD, which is designed for large and complex designs. There are four main product lines within AutoCAD: AutoCAD, AutoCAD LT, AutoCAD WS and AutoCAD WS and Technology Edition. The main difference between the product lines is the purpose of the software: AutoCAD (1) Desktop application designed for engineers, architects and other designers. (2) Extends the capabilities of AutoCAD WS, and has the same capabilities as AutoCAD LT. (3) Desktop applications provide no Internet or network access; require a network connection to communicate with the CAD server. AutoCAD LT (1) Desktop application designed for engineers, architects, and other designers for smaller business. (2) Has the same features as AutoCAD, but runs on computers that have the Microsoft Windows operating system. (3) Requires an Internet connection to communicate with the CAD server. AutoCAD WS (1) Standalone application that does not require a network connection to communicate with a CAD server. (2) Desktop application that extends the capabilities of AutoCAD LT and works with existing AutoCAD LT programs. AutoCAD WS and Technology Edition (1) Desktop application that does not require a network connection to communicate with a CAD server. (2) Desktop application that extends the capabilities of AutoCAD LT and works with existing AutoCAD LT programs. AutoCAD LT AutoCAD LT desktop application. The desktop CAD application is designed for engineering and architecture firms that need to draft, manage, review and review engineering and architectural design models. AutoCAD LT (standalone) The standalone application is a desktop CAD application that provides the functionality and is fully functional without the assistance of a network connection to a CAD server. AutoCAD LT for Education AutoCAD LT for Education is used to create and manage engineering and architecture educational models. AutoCAD LT for Industry AutoCAD LT for Industry is used to create and manage engineering and architecture models for industry-specific projects. AutoCAD LT for Architectural Design

Open Autocad Create a new drawing file Use the New Drawing option Select the type of drawing from the available choices (see screenshot below). The options available include: 2D AutoCAD/DraftSight, 2D DWG, 3D DWG, 3D CAD, 3D GRID, 3D VX/VJ, 3D STL, 3D MDD, 3D SolidWorks, 2D DWG, 2D CAD, etc... Pick the option you need. When creating a new drawing, the drawing is by default placed in the Autocad\Projects folder. You can however, pick another location, like your desktop. Select the drawing you want to make a backup. The Burzynski Clinic has claimed that an article I wrote about the Burzynski Clinic in the New England Journal of Medicine was a "scientific fraud." The clinic makes no apologies for the claim, including by one of its own lawyers. I responded to the lawsuit by arguing that it is not only frivolous but also a public relations stunt meant to interfere with science. Burzynski Clinic files frivolous lawsuit against FTC after FTC rejects clinic's libel suit. Most importantly, I used facts. In my original post I cited the Burzynski Clinic's own advertising that refers to people who contact the clinic saying their loved ones have had a remission. In most cases, these people are dead. So, in effect, the clinic is saying that people who died while under its care had a remission. I also cited a recent study which found no evidence to support the clinic's claims. Burzynski Clinic files frivolous lawsuit against FTC after FTC rejects clinic's libel suit. The clinic reacted by suing the Massachusetts attorney general and the FTC. According to the Massachusetts attorney general: The Office of Attorney General filed this action on behalf of the citizens of the Commonwealth to prevent the Burzynski Clinic from continuing to defraud the public with fraudulent claims that its treatment has cured and/or significantly benefited cancer patients when that is not true. A Massachusetts patient paid the Burzynski Clinic over \$1.4 million for his treatment, which included (1) a series of treatments at the Burzynski Clinic in Houston, Texas; (2) five chemotherapy treatments at the University of Texas M.D. Anderson Cancer Center; and (3) an experimental drug, though labeled for other uses. Shape drawing functions improve and are easier to use. You can adjust the size of the width and height of a polyline and an arc. You can use a polar (angle) coordinate system for measuring radial arcs. When you use the relative measure function (hold down Shift or Ctrl and then press the Up or Down cursor keys), the coordinate system (field of view) changes so that the width and height of an arc are based on its actual diameter rather than on the working drawing unit. When you use the relative measure function, the field of view is based on the actual diameter of an arc. When you are working with large drawings, navigating to and from commands can be time consuming. There are two new Navigate to commands: Navigate to Current and Navigate to Current in This View. Navigate to Current searches the drawing for the current model space object. Navigate to Current in This View is similar but searches only for objects in the drawing view. You can now send parts, entities, or blocks to the command line. The new Send and Send to menu choices are helpful if you are sending a list of objects or blocks to the command line. When you select the Align tab of the Selection Options dialog box, you can now align block boundaries to workplanes and fit by vertices. The text display tool, Text Style, can now handle underscores (_). Command Line Toolbar: You can customize the ribbon buttons on the command line. You can use any font of your choice, change the color of each button, and change the foreground and background colors of the buttons. You can assign labels to the button headings. The button labels will display under the ribbon buttons. You can hide, lock, and un-lock ribbon buttons. You can control the behavior of the Backspace key. When you are dragging something on the screen, you can see the cursor image and details of the object. The cursor can also be hidden while you are dragging. You can use the control panel to change the name of a command on the command line. The Title Bar drop-down box allows you to specify the location of the title bar. The automatic axis scaling button in the Ribbon tab of the Options dialog box can now be accessed when you have Ribbon selected. When you insert a path, you can increase the thickness of the line by using a new command
