Trace Analyzer for SQL Server is an open source tracing tool that integrates into the SQL Server 2005/2008 and SQL Server 2008/2008 R2 server environments. It works with any trace or trace file format shipped with the current release of SQL Server. This also includes supporting tooling for the Microsoft SQL Server 2008 Trace Analyzer, such as DBSophic's.NET Tools for SQL Server. The Trace Analyzer is different from the SQL Server Trace Manager because it can work with any SQL Server trace or trace file format. It also includes a graphing capability. The Trace Analyzer has a sophisticated concept of "groups" that stores trace events in a data structure and visualizes that data in a tree structure.
